Kyoto: the Heat is On

The formal Conference of the Parties to the Climate Change Convention takes place on 1st-10th December, 1997 in Kyoto, Japan. The 166 nations that have joined the Convention will review the draft agreement, make amendments, and decide whether or not to sign on. The meeting will be attended by environment and energy ministers, aiming to adopt a protocol to establish the first legally-binding commitments to reduce greenhouse gas emissions.

Shell on Earth

In the 100 days leading up to the International Climate Change Conference in Kyoto, various groups have been conducting the 100 Days of Action Campaign against the oil industry. Shell's 100th birthday on October 18th fell within the 100 days, and TAPOL, the Indonesian human rights campaign, held a protest in conjunction with the Campaign outside the official Shell Birthday Party for investors. TAPOL accuses Shell of complicity in Indonesia's brutal and bloody suppression of basic rights and freedoms in East Timor, and has criticised the company's plans to prospect for oil in the Indonesian government in Timor's seas. Shell has also been accused of violating indigenous people's rights in Nigeria, and was ordered by the Nigerian Supreme Court to pay hundreds of thousands of dollars in damages after being sued by a group of villages in the Niger Delta.

Global Warming: The Vicious Circle

Scientists are predicting that human-induced global warming could produce numerous "feedback loops" which would accelerate climate change. A hotter Earth will result in tens of thousands more forest fires annually, releasing millions of additional tonnes of CO₂ into the atmosphere and destroying one of the planet's natural carbon "sinks". In addition, the melting of the ice caps due to longer arctic summers will reduce the percentage of the Earth covered by reflective white surfaces, increasing the area of the planet that is darker and which therefore absorbs more solar heat.

Call to Clinton

In a letter to US president Bill Clinton, members of the Oil Alert Network have voiced their concerns over the increasing involvement of US companies in the exploration and export of Venezuelan oil. Expressing their horror over the pollution of Lake Maracaibo and the continuing destruction of unique mangroves and swamp in the Orinoco river delta, the letter laments US efforts to promote an "oil boom" in Venezuela. The Oil Action Network comments on the numerous indigenous groups clamouring for a halt to oil-led ecocide, and wonders how these peoples go utterly unheeded "in a country which is said to be democratic and respectful of the observance of human rights...".

Bloody Petroleum

Thousands of balloons released in an attempt to break the world record failed to grab the attention of onlookers and media at British Petroleum's open day at Saltend Chemical Works in Hull in September. Activists dressed as skeletons and corporate "fat cats" distracted security while others clambered behind a huge structure on which thousands of BP branded balloons were set to be released. The balloons were launched as part of a publicity stunt in the north-east of England city. But as the last of the balloons was added and the cameras snapped, attention switched to the activists atop the structure, who had unfurled a banner displaying the words "Bloody Pollution", in protest at BP's involvement in Colombia. Leaflets were then passed around explaining the situation in the South American country, currently beset by corruption and suffering under bloody massacres by military death-squads.

Global Warming: The Vicious Circle

There is already speculation as to whether recent changes of the El Niño current and the extended drought in Indonesia could be attributed to global warming. Kevin Trenberth, of the National Center for Atmospheric Research, has calculated that the El Niño current, which affects climatic patterns worldwide, changes naturally once every 2,000 years. The rapid rate of change in recent years suggests a break in that pattern which is believed to be linked to alterations in global climate conditions, triggered by increased greenhouse gas emissions.

The Ecologist

Women of the Amazon Say “No” to Oil Companies

The indigenous women of the Amazon area who represent “Pacha Mama” (“our sacred Mother Earth”) have walked from Puno, Putazan, to Quito in Ecuador to present a proposal to the government to save their habitat from oil exploration. The new government of Ecuador has wasted no time in selling the last remaining old growth rainforests to national and transnational corporations. Oil wells, logging, and petroleum pipelines through earthquake-prone seismic zones are posing the most imminent threat. The proposal states, “After analysing the life-threatening situation that the indigenous communities and peasants of the province of Pastaza in Ecuador are encountering by the presence of the oil companies in their province, we have come to see that our last hope is to preserve and defend the few natural resources that have been left to us of our territory. The preservation of the jungle and its biodiversity represents the survival of our culture and future generations.

Nicaraguan Rainforest Anti-Logging Action

The International Day of Action for the rainforest and indigenous peoples of Nicaragua’s North Atlantic Autonomous region is being held on November 10th, 1997. This is in response to the government of Nicaragua’s decision to grant logging concessions to SOLCARSA, a subsidiary of the Korean multinational corporation Kum Kyung. SOLCARSA has begun the process of cutting into Central America’s largest rainforest. Roads are being built and it has been claimed that SOLCARSA has already forcibly evicted one indigenous community from its land. It appears that in their attempt to cut down the rainforest, SOLCARSA are destroying traditional cultures and denying the indigenous peoples a future in their homeland.

Indonesian Fires Cause Unprecedented Environmental Damage

The Indonesian fires have burned 1.85 million acres of bush and forest land are turning out to be one of the worst environmental disasters ever, causing more damage than other previous disasters such as Chernobyl or the massive EXXON Valdez offshore oil spill.

The devastating impact of the fires is vast and far-reaching:
- The health of more than 20 million workers and their families has been harmed
- 1.85 million acres of bush and forest land have been destroyed
- renewable crops and fisheries have been wiped out.

A report by the World Wide Fund for Nature states that 80% of the fires were set by big forestry and plantation firms systematically clearing land. The background to this appalling devastation was a grossly distorted policy of “sustainable development” carried out by forest companies and large plantation owners with the approval of the Indonesian Government. Forest land that was deemed “degraded” due to previous logging operations was then clear-cut under government law. This, combined with extended drought and unusually hot weather, has led to the massive destruction of the tropical forest base.

The Indonesian Government has finally acted and revoked the logging licences of 29 timber firms implicated in the fires. The official Antara news agency said the move followed an ultimatum to 176 companies to account for their actions after satellite data images showed some of the worst areas of devastation on land licensed to the firms.

Whether the Indonesian Government will enforce stricter controls remains in question. The export of logs is illegal so they are milled first. The plywood trade is a cartel controlled by Mohammad “Bob” Hasan, a billionaire who is President Suharto’s golf partner. Powerful friends of the Suharto family involved in the logging industry have remarkably few legal problems when they clear forest land in order to set up plantations of oil palms, eucalyptus and acacia trees for paper and pulp.

In England, Friends of the Earth reports that some British importers continue to purchase thousands of cubic yards of wood from Indonesian companies that have ignored government bans on burning in plantations and timber estates during the dry seasons. Friends of the Earth is campaigning to stop all business with Indonesian logging firms.

Ecological villages: Building an Alternative Future

The Global Eco-village Network (GEN) is an evolving network of eco-village projects around the world aiming to build on-the-ground examples of sustainable living. The organisation consists of a number of diverse groups responding to the need to address the ecological, spiritual or social crises in mainstream society. The eco-villages all tend to work on a positive vision for the future, and represent both a strategy for global change and an ongoing movement to carry it out on a practical level. Everyone is welcome to join the GEN regional networks without conditions. This includes eco-village projects as well as individuals and organisations that have an interest in what is happening.

Growing Support for Organic Food

UK Agriculture Minister Dr Jack Cunningham voiced his strong personal support for organic produce at an international conference on The Future Agenda for Organic Trade held in Oxford in September. "I firmly intend to promote more rapid conversion to organic farming within the UK," Dr. Cunningham said.

"The Common Agricultural Policy currently costs European Union taxpayers £28 billion a year. It must be a priority to reduce this cost and redirect some resources to organic farming and rural enterprise."

At the same conference, HRH The Prince of Wales made a plea through a video message to keep genetically manufactured organisms (GMOs) out of organic agriculture. The Prince said that people who bought organic food were supporting farming systems which produced safer and more nutritious food.

Peter Sagar, speaking for the group Organic Farm Foods, predicted a future explosion in organic trade based on the current level of global organic trade today.

Curbs on Bio-Piracy in India

An independent Indian commission has recommended a comprehensive biodiversity law based on community ownership, with the government acting as a trustee for non-local and commercial trade in biodiversity and traditional knowledge. The People's Commission on Biodiversity, Indigenous Knowledge, and People's Rights, established in March of this year, was responsible for studying the loss of India's biological resources as well as the plundering of traditional knowledge by multinational companies. The results of this study will be presented to the government as it makes changes to current patent laws. During hearings in Delhi, the Commission talked with farmers, representatives of the seed industry and tribal groups, as well as scientists, to learn about the impact "bio-piracy" would have on their livelihoods and on the nation as a whole. Hearings will also be held in other parts of India.

Modifying Genes, Modifying Markets

Brazil has overturned its import ban on Genetically Modified Organisms (GMOs) by authorizing the importation of 1.5 million tonnes of US soybeans, at least 15% of which contain Monsanto's transgenic Roundup Ready variety. The decision, made by the Brazilian National Technical Commission on Biosafety (CTNBio), was announced in an atmosphere of intense pressure from both the Brazilian processing industry and the US Department of Agriculture (USDA). Global demand for Brazil's own GMO-free soybeans soared this year, sending commodity prices through the roof. In September, Brazil exported more than usual and was caught short in the scarce period. Representatives of the USDA met with their Brazilian counterparts early in October to reinforce ABIOVE's demands. Although reluctant to allow the genetically imported soya to be imported, the government eventually relented.

The US arm-twisting centred on two arguments. The first was that Brazil ought to acknowledge the principle of "mutual recognition" - essentially that countries should accept that genetically modified foods already approved in the country of origin are safe. Secondly, the US suggested that it is not possible or economically feasible to segregate the transgenic beans from the conventional ones.

Both assertions appear dubious. The US is not even party to current negotiations under the Convention on Biological Diversity on developing a Biosafety protocol to regulate the international distribution of GMOs. Strong consumer opposition in Europe against being force-fed transgenic soya has created a high demand for certified non-transgenic sources. Cargill, ADM, and other grain cartels are already segregating and sourcing non-transgenic soya and maize and supplying it secretly to some of their major European consumers.

The genetic contamination of Brazil, one of the most biologically diverse countries on Earth, is the latest step in a concerted campaign by proponents of genetic engineering to push their dangerous technology onto farmers and consumers all over the world.

Mile-High Madness

On 5th and 6th December, environmental organizations in sixteen European countries will demonstrate at airports to draw attention to the environmental consequences of air transport. This action day is part of the joint European campaign, "The Right Price for Air Travel".

European governments keep the price of flying artificially low. Aeroplane tickets, fuel for aeroplanes and transport of goods by air are all VAT-free. Kerosene, unlike petrol, meets no environmental charges or excise duties. Furthermore, the European air transport industry is supported both by substantial investment in infrastructure near airports and through direct subsidization of airlines and smaller airports.

As a result, European air traffic is rapidly increasing, with an annual growth rate of 6% expected in the coming decade. This would have serious consequences for the environment. Aeroplanes emit nitrogen oxides, which not only contribute to acid rain, but act as ozone depleters when emitted at high altitudes. Scientists predict that in 2015 half the annual destruction of the ozone layer will be caused by air traffic.

This short-sighted attitude towards air traffic and its ecological impacts has prompted European environmental organisations to set up a joint campaign fighting to make the price of tickets and fuel reflect the environmental costs of air transport. The campaign includes actions directed against new and expanding European airports, both large and small.

Cuba's Organic Revolution

Organic agriculture has been adopted as the official government strategy for all new agriculture in Cuba, after its highly successful introduction just seven years ago.
ago. In less than a decade the use of chemical pesticides has dropped by 80%. The island is self-sufficient in organic fruit and vegetables, and organic livestock is also reared successfully. Even cabbage, previously impossible to grow due to infestations of the diamond black moth, now has yields of 60 tonnes per hectare without the use of chemical fertilizers or pesticides.

To meet the demand of a more labour-intensive system of agriculture, the Cuban government has increased rural wages and is providing favourable housing for farm workers – helping to relieve the problem of housing shortages and overcrowding in the cities. It is also making abandoned land in urban areas available for local communities to farm. In one cooperative, 40 members are providing food for their own families, with plenty of surplus for local community day-care centres.

Cuba was recently host to representatives from over 40 countries at the Pesticide Action Network (PAN) conference, at which participants challenged the view that pesticides are essential to agriculture.

Genetically Engineered Plants

Greenpeace International, the International Federation of Organic Movements, the Sierra Club, the National Family Farm Coalition, RAFI and 20 more farmers and environmental organizations have filed a legal petition against the US Environmental Protection Agency (EPA) requesting the cancellation of all approvals of transgenic B.t.-plants.

Interested co-petitioners, please E-mail to: Greenpeace International Genetic Engineering Department; barbara.kuepper@greenpeace.de

Disney’s Sweatshops

The World Development Movement (WDM) has unveiled the reality behind the fairytale in its latest report, The True Face of Disney. Despite the fact that Walt Disney is the world’s largest entertainment company, ranking among the richest top 200 multinationals, the WDM has revealed that conditions in its Third World factories are often appalling, breaking the corporation’s own ‘Code of Conduct’.

Nineties producing Disney clothing in Haiti are keeping wages down to the lowest salary legally allowed; forcing workers to work overtime with little additional pay; sacking workers who join a union; and refusing sickness and maternity leave. A worker reports, “They see us like animals: we don’t have the right to express a view.”

In the face of growing consumer concern and pressure, many companies are adopting codes of conduct that aim to improve the conditions under which their products are made. The Disney Code recognizes “the rights of employees to associate, organize and bargain collectively”, and states, “Manufacturers will prominently post a copy of this Code of Conduct in the local language and in a place accessible to employees at all times.”

WDM campaigner Aditi Sharma says, “Disney’s Code of Conduct claims to recognize workers’ rights, but the Haitian workers have never even heard of it. Unless Disney ensures that working conditions meet its own guidelines the code is little more than a public relations scam.”

The facts speak for themselves:

- Disney spent $22 million marketing Hercules in the US – nine times as much as all of its 7,000 garment workers in Haiti earn in one year.
- Haitian women sewing Disney T-shirts are paid just 17 pence an hour. It would take a Haitian worker 14½ years to earn the $36,250 that Michael Eisner, Disney’s chief executive, earns every hour.
- Last month the general secretary and co-ordinator of the union in one factory were dismissed for requesting the management to negotiate on terms and conditions.
- In the same factory only three toilets were provided for 250 workers, two of which were blocked. A dead toad was found in the water tank, forcing workers to bring drinking water from home.
- “Improving conditions in these factories is not a Herculean task,” states the WDM report. “Disney can well afford to give its workers a fair deal.”

Tour de Quebec

At the end of August 80 cyclists embarked on a 350 km journey from Montreal to Quebec City to promote the bicycle as a non-fossil fuel mode of transport. The cyclists, from Quebec and several foreign countries, took seven days to complete their journey, and participated in discussions on climate change held each night at rest stops along the route. At one stage, they stopped at the home of Canada’s prime minister, Jean Chrétien, to urge him to uphold Canada’s promise to meet targets for greenhouse gas emissions set at the Rio Conference in 1992. The culmination of the tour took place in front of the provincial parliament building, where a priest at the head of a choir laid a black shroud on a car to symbolize the end of the Age of the Automobile.

Labour U-turn on Whales

During its election campaign, the Labour Party stated “on welfare and conservation grounds, we are completely against commercial whaling.”

Elliott Morley, Minister for Agriculture, Fisheries & Countrywide, is now advocating whaling within the Exclusive Economic Zones (EEZ) – so exclusive that they comprise 25% of the world’s oceans, an area equivalent in size to the Atlantic Ocean.
